20. ABSTRACT *(Continue on reverse side if necessary and identify by block number)*

An experimental investigation of the refraction of surface gravity waves by relatively narrow (of the order of or less than one wave length) and shallow, laterally sheared, surface currents was undertaken to determine the feasibility of employing artificially-generated currents to achieve local wave damping in the ocean. In the experiments, single frequency wave trains (wave length, λ_o, in still water) were initially propagated in the same direction as the direction of the current in the
